Capsular polysaccharide-protein conjugate vaccines

Sood, RK; Fattom, A; Pavliak, V; Naso, RB

Abstract:
The conjugation of polysaccharides to carrier proteins generally enhances polysaccharide immunogenicity and renders the immune response T-cell dependent. Such enhancement of immunogenicity has made the use of conjugate vaccines possible in populations that are otherwise unresponsive to polysaccharide vaccines. Here, the authors discuss the value of capsular polysaccharide vaccines, their ability to elicit protective immunity against infectious bacteria, the selection of appropriate polysaccharides...

Pavliak, V; Nashed, EM; Pozsgay, V; Kovac, P; Karpas, A; Chu, Chiayung; Schneerson, R; Robbins, JB...

Abstract:
...monoclonal murine IgM for 26 fragments of, or related to, the structure of the O-polysaccharide and of the IgM Fab for the intact O-specific bacterial polysaccharide. Synthetic saccharides used were methyl glycosides to ensure an anomerically defined pyranosyl ring conformation. Measurements using IgM Fab and the intact O-specific polysaccharide show that the antibody can bind internal segments

on the antigen chain. The free energy...

Title: Structural elucidation of the capsular polysaccharide of Bacteroides fragilis strain 23745M1
Document Type:
Author: Pavliak, Viliam; Uhrin, Dusan; Brisson, Jean-Robert; Tzianabos, Arthur O.; Kasper, Dennis L.; Jennings, Harold J.
Patent Assignee:
Abstract: ... of which could not be accomplished.The mouse-passaged strain (23745M1), however, yielded a preponderant polysaccharide which was isolated and purified.Using mainly high resolution NMR spectroscopy, the structure of the polysaccharide was elucidated and it is composed of the following repeating unit: (formula) where alpha -L... ... is 3,6 dideoxy-4-C-(L-glycero-4'-hydroxyethyl)-alpha -D-xylo-hexopyranoside.Keywords: Polysaccharide ; Bacteroides fragilis; NMR

Novel sucrose-dependent adhesion co-factors in Streptococcus mutans.

Streptococcus mutans glucosyltransferases form extracellular glucans from sucrose to promote adhesion to the teeth. We tested whether additional factors are involved in S. mutans sucrose-dependent adhesion. By screening a pVA891-insertion mutant library of S. mutans LT11, we isolated four clones deficient in adhesion to glass in the presence of sucrose, but normal in glucosyltransferase activities. The genetic loci... ...to the wild type. Therefore, these four factors may contribute to S. mutans sucrose-dependent adhesion.

Characterization of the Caulobacter crescentus holdfast polysaccharide biosynthesis pathway reveals significant redundancy in the initiating glycosyltransferase and polymerase steps

Caulobacter crescentus cells adhere to surfaces by using an extremely strong polar adhesin called the holdfast. The polysaccharide component of the holdfast is comprised in part of oligomers of N-acetylglucosamine. The genes involved in the export of the holdfast polysaccharide and the anchoring of the holdfast to the cell were previously discovered. In this study, we identified a cluster of polysaccharide biosynthesis genes (hfsEFGH) directly adjacent to the holdfast polysaccharide export genes. Sequence analysis indicated that these genes are involved in the biosynthesis of the minimum repeat unit of the holdfast polysaccharide. HfsE is predicted to be a UDP-sugar lipid-carrier transferase, the glycosyltransferase that catalyzes the first step in polysaccharide biosynthesis. HfsF is predicted to be a flippase, HfsG is a glycosyltransferase, and HfsH is similar to a polysaccharide (chitin) deacetylase. In-frame hfsG and hfsH deletion mutants resulted in severe deficiencies both in surface adhesion and in binding to the holdfast-specific lectin wheat germ agglutinin. In contrast, hfsE and hfsF mutants exhibited nearly wild-type levels of adhesion and holdfast synthesis. We identified three paralogs to hfsE, two of which are redundant to... ...holdfast synthesis. We also identified a redundant paralog to the hfsC gene, encoding the putative polysaccharide polymerase, and present evidence that the hfsE and hfsC paralogs, together with the hfs genes...

Generating a Staphylococcus that overproduces a polysaccharide useful as a vaccine against staphylococcal infection comprises introducing into a bacterium an intercellular adhesion (ica) nucleic acid linked to an ica regulatory nucleic acid polysaccharide production via plasmid expression in host cell for in vaccine
Abstract: DERWENT ABSTRACT: NOVELTY - Generating (M1) a (Staphylococcus) bacterium that overproduces polysaccharide by introducing into a bacterium an intercellular adhesion (ica) nucleic acid operably linked to an ica regulatory nucleic acid, is new. DETAILED DESCRIPTION - Generating (M1) a (Staphylococcus) bacterium that overproduces polysaccharide comprises: (a) introducing into a bacterium, an intercellular adhesion (ica) nucleic acid operably linked to an ica regulatory nucleic acid (II), where the (II... ...between and including nucleotides 9 and 43 of (S1), and that enhance production of a polysaccharide from an ica locus, and their complements, (b) introducing into a bacterium an ica nucleic acid operably linked to (II), where (II) comprises a mutant icaR nucleic acid, and measuring polysaccharide production from the bacterium, where a high level of polysaccharide production is indicative of (I) (c) recombinantly down-regulating wild-type IcaR protein production, and... ...ica promoter region. INDEPENDENT CLAIMS are also included for: (1) a recombinant bacterium which overproduces polysaccharide and comprises an ica nucleic acid operably linked (II), where the bacterium is not MN8... ...MN8m), or a mutant icaR nucleic acid; (2) producing (M2) an antibody to a bacterial polysaccharide, by isolating a bacterial polysaccharide from (I), administering the isolated bacterial polysaccharide to a subject to produce an antibody, and harvesting antibody from the subject; (3) an... ...and its complements, where the fragment spans a MN8m mutation and enhances production of a polysaccharide from an ica locus when operably linked to an ica nucleic acid; (4) an expression...
...indicative of an isolated binding agent; (7) identifying (M4) an ica promoter sequence associated with polysaccharide overproduction, involves detecting a nucleic acid molecule having a sequence alteration from wild-type in... ...and 43 of (S1); (8) identifying (M5) an ica regulatory nucleic acid molecule that enhances polysaccharide production, by altering a nucleic acid molecule having (S1), and

determining a level of reporter... ...higher than wild-type level of reporter protein production is indicative of (II) that enhances polysaccharide production; (9) a composition (C1) comprising an isolated binding agent that binds to a nucleic... ...disclosed. BIOTECHNOLOGY - Preferred Method: The steps (a), (c) and (d) of (M1), further involve measuring polysaccharide production from the bacterium, where a high level of polysaccharide production is indicative of (I). (II) comprises a fully defined sequence of 55 base pairs ... ...IcaR protein that binds to a target less efficiently than wild-type IcaR protein. The polysaccharide is poly-N-acetyl glucosamine (PNAG). In (c) of (M1), the wild-type IcaR protein... ...nucleic acid molecule with the candidate molecule to determine if the candidate molecule is a polysaccharide molecule is a polysaccharide synthesis modulator, where the candidate molecule is a polysaccharide synthesis modulator if expression from the reporter construct is altered. The candidate molecule is a... ...nucleic acid molecule, is indicative of the presence of an ica promoter sequence associated with polysaccharide over-production. The nucleic acid molecule is detected by contacting a candidate nucleic acid with... ...In (M5), the reporter nucleic acid is an ica nucleic acid and reporter production is polysaccharide production. The nucleic acid molecule is altered recombinantly, or altered naturally during bacterial culture. (M6... ...protein G, a mammalian protein, viral protein, fungal protein, parasite protein, fibrinogen-binding protein, vaccine carrier protein, or IcaA, IcaD, IcaB or IcaC. Preferred Bacterium: In the recombinant polysaccharide over-producing bacterium, the mutant icaR nucleic acid is a deletion of wild-type icaR... ...ACTION - Vaccine; Anti-poly-N-acetyl glucosamine antibodies. USE - (M1) is useful for generating a polysaccharide over-producing bacterium, such as Staphylococcus, which is chosen from S. epidermidis, S. aureus, S ... ...S. pasteuri and S. piscifermentans, where the recombinant bacterium is useful for producing a bacterial polysaccharide, which involves culturing the bacterium in a growth medium, and harvesting the bacterial polysaccharide from the culture. The bacterial polysaccharide is composed of beta 1-6 linked glucosamine units, where 0-100% of the units are acetate substituted, or less than 50% of the units are acetate substituted, and the polysaccharide is useful in producing antibody in a non-human subject such as rabbit or mouse. The method further involves formulating the bacterial polysaccharide as a vaccine (claimed). The polysaccharide produced using (I), is useful for immunizing humans and animals against infection by Staphylococcus bacteria... ...or infected with infectious agents. ADVANTAGE - (M1) enables generation of bacterium capable of over-producing polysaccharide such as poly-N-acetyl glucosamine (claimed). EXAMPLE - Expression plasmid pCRT7-NT was used to... ...histidine residues and an Xpress epitope to the amino-terminus of the protein. The intercellular adhesion (Ica)-R TcaR proteins and the vector expression control were sequentially purified. The lac operon...
E.C. Numbers:
